Alert group	<b>Cookies with missing, inconsistent or contradictory properties (verified)</b>
Severity	Low
Description	At least one of the following cookies properties causes the cookie to be invalid or incompatible with either a different property of the same cookie, of with the environment the cookie is being used in. Although this is not a vulnerability in itself, it will likely lead to unexpected behavior by the application, which in turn may cause secondary security issues.
Recommendations	Ensure that the cookies configuration complies with the applicable standards.

Alert group	Sensitive pages could be cached
Severity	Low
Description	One or more pages contain possible sensitive information (e.g. a password parameter) and could be potentially cached. Even in secure SSL channels sensitive data could be stored by intermediary proxies and SSL terminators. To prevent this, a Cache-Control header should be specified.
Recommendations	Prevent caching by adding "Cache Control: No-store" and "Pragma: no-cache" to the HTTP response header.

### Alert group

**Session cookies scoped to parent domain (verified)**

### Severity

Low

### Description

One ore more session cookies are scoped to the parent domain instead of a sub-domain. If a cookie is scoped to a parent domain, then this cookie will be accessible by the parent domain and also by any other sub-domains of the parent domain. This could lead to security problems.

### Recommendations

If possible, the session cookies should be scoped strictly to a sub-domain.

Alert group	Session token in URL
Severity	Low
Description	This application contains one or more pages with what appears to be a session token in the query parameters. A session token is sensitive information and should not be stored in the URL. URLs could be logged or leaked via the Referer header.
Recommendations	The session should be maintained using cookies (or hidden input fields).

Alert group	Content Security Policy (CSP) not implemented
Severity	Informational
Description	<p>Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.</p> <p>Content Security Policy (CSP) can be implemented by adding a <b>Content-Security-Policy</b> header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for the all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:</p> <div><pre>Content-Security-Policy:      default-src 'self';      script-src 'self' https://code.jquery.com;</pre></div> <p>It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.</p>
Recommendations	<p>It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the <b>Content-Security-Policy</b> HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.</p>
Alert variants	

Details	<p>Paths without CSP header:</p> <ul style="list-style-type: none"><li>https://www.modelhub.com/</li></ul>

Alert group	Subresource Integrity (SRI) not implemented
Severity	Informational
Description	<p>Subresource Integrity (SRI) is a security feature that enables browsers to verify that third-party resources they fetch (for example, from a CDN) are delivered without unexpected manipulation. It works by allowing developers to provide a cryptographic hash that a fetched file must match.</p> <p>Third-party resources (such as scripts and stylesheets) can be manipulated. An attacker that has access or has hacked the hosting CDN can manipulate or replace the files. SRI allows developers to specify a base64-encoded cryptographic hash of the resource to be loaded. The integrity attribute containing the hash is then added to the &lt;script&gt; HTML element tag. The integrity string consists of a base64-encoded hash, followed by a prefix that depends on the hash algorithm. This prefix can either be sha256, sha384 or sha512.</p> <p>The script loaded from the external URL specified in the Details section doesn't implement Subresource Integrity (SRI). It's recommended to implement Subresource Integrity (SRI) for all the scripts loaded from external hosts.</p>
Recommendations	<p>Use the SRI Hash Generator link (from the References section) to generate a &lt;script&gt; element that implements Subresource Integrity (SRI).</p> <p>For example, you can use the following &lt;script&gt; element to tell a browser that before executing the https://example.com/example-framework.js script, the browser must first compare the script to the expected hash, and verify that there's a match.</p> <div><pre>&lt;script src="https://example.com/example-framework.js"       integrity="sha384-oqVuAfXRKap7fdgcCY5uykM6+R9GqQ8K/uxy9rx7HN       crossorigin="anonymous"&gt;&lt;/script&gt;</pre></div>
